well the article above suggests that areas with low-alkalinity Tuscarora bedrock will have worse acidity in streams, so they may be less likely to have trout. I looked at some areas with that bedrock ... tuscarora bedrock areas are in lime green below (for ex, SE of Williamsport and just S of Middleburg).

Most PA ridges have different bedrock, so maybe more brookies... For ex, the article above says some non-Tuscarora streams had median pH of 6.3, and streams w/no acid rain effect might be 6.5 pH... still, I have fished in some of these tuscarora bedrock areas, will try to consider this issue in this part of the state.
