Acid rain is a problem and will continue to be a problem. After all, all of those native brook trout lakes spread throughout the Adirondacks have been hurt very badly by acid rain and invasive species. Pike, bass, and perch are all major concerns in overshadowing the brook trout there. Is it bad? Yes and no. If the water is too acidic for brook trout anyway there might as well be some fish in there. I love them all. I do wish that things would stay "undamaged" and "unchanged" but we all like cars, electricity, and what not and it is going to be nearly impossible to balance it all with the ever growing human population.
