right our acid rain is on the wane. not defending anything of course, but PA has had both acidic rain and BT introduced w. human intervention.

in some cases acidic rain + slightly more alkaline geology = brook trout in waters too acidic for browns. in many other cases, the water is too acidic even for ST. it's about rain and rocks, among other things of course.

(map: blue line is class a brookies, Juniata geology is higher alkaline than Tuscarora. ... there are ST streams with good pH even in areas where many streams are too acidic for trout...)

again I am not defending acid rain, just looking @ where to fish, or not...
