The polarchromic amber certainly lets in more light, but I found the tint to be less optimal than the copper. The copper still will allow up to 20% VLT, which is significantly more than your typical brown polarized lens and vastly more than the blue/green mirror lenses you see many people wearing on the stream.

I'd probably like the copper even more if it had a wider range, but the tint made it win out over the amber .. for me, at least.
