Also the early hatches are effected much more than the mid season ones due to cold long winters. One other note is the early Hendricksons are usually heavy for a few days under normal winter spring conditions compared to the winter we had last year. Our Grannoms and Hendricksons seem to be coming off in small spurts. This is the first year in over 30 years there have been spinners and duns at the same time. It will be interesting to see what happens with the Sulphurs.
