Only one way to really find out....put it into C&R ALO for 5 years and continue to monitor fish populations and size distribution.

I don't think one can make a conclusive decision either way. It may be habitat or lack there of, OR, it may be due to creeling.

No brainer....again!!

Actually, there are at least a couple ways to test the theory espoused by some: an alternative to yours would be to lower the Trophy Trout length requirement to 12" for 4 years and see if there is a drop-off at 12". I can probably think of another few ways to adequately test the hypothesis.
