I thought we were testing the theory that creeling at 14" is the limiting factor. If so, we should see the same effect by lowering the limit to 12". No, there are more ways to test the hypothesis than the proposal you suggest.

I know...but if the stream doesnt have the habitat to grow fish larger than 14"....than the TT regs would work in this case by protecting the fish under 14". If it can grow higher populations of 14" or larger fish under C&R, then it may be a candidate for that type of regulation...if that is the goal...to have and grow a higher populations of larger fish.
