Am I reading this correctly? For Brookies, you need at least 30 kg/ha of any size and 0.1 kg/ha of little ones.
Similarly for Browns, you need at least 40 kg/ha of any size and 0.1 kg/ha of little ones. But for Rainbows, its
only the density of little ones of at least 2.0 kg/ha that matters.

Why does a rainbow stream need 20 times the density of little fish to qualify as class A?

I'm guessing they don't want to have a lot of wild rainbow streams on the class A list.
