I would say brook trout individuals are fragile. Brook trout populations, on the other hand, are resilient. At least they are resilient to things like harvest.

They are not resilient to environmental factors like all of the other factors mentioned. And I believe it was wildtrout who mentioned stocking, yes, this will harm a wild brook trout population. But the question of whether to stock, and whether to limit harvest, are separate discussions. There is nothing saying that open regulations mean it has to be stocked.
