I understand what you are saying Jack and for the most part I do not disagree.

I simply objected to the notion that in an overall picture of health in a trout population, regs are irrelevant (or completely separate) as a component of a management strategy to conserve a population that is already undergoing other stresses. I realize this is not \*exactly\* what you suggested, but it seems the logical conclusion of the line of reasoning you were following.

Again, I tend to see this more holistically and feel that both regs and environment/habitat stresses are components of a single equation that can determine the overall well being of a trout population.

Otherwise, we're pretty close to being in the same chapter, although probably not on the same page..
