Early April Mayfly ID Help

Hi folks,

This is my first season taking fly fishing pretty seriously and I managed to catch my first two trout on a dry fly April 14

They took a parachute Adams and I thought it would be cool to know the predominate bug on the water and what my fly may have been imitating during that accomplishment. It was on a wild trout stream in southeastern PA.

I do not profess to know much of anything about bug ID, so any help here would be appreciated!
