Just to be clear...getting a twisted leader (wind knots) are not caused by the fly, they are caused by an improper casting stroke. With that said, let me say next, I get them all the time. I use the micro mesh and like it too. But if you have problems with your cast, even hackle tips or mallard flank or micro mesh or whatever will twist your leader. So I see no harm in it. Though I do think a solid wing as opposed to a wing that allows some air flow, should twist less. As I told the guy who last reminded me that it was my cast and not the fly, "yes, but any help I can get to counter my casting flaws are greatly appreciated..."
