If we truly want to reduce CO2 emissions, the only long term solution is nuclear power. Yes, there may be a large plant with steam coming from the cooling towers but it's not thousands of acres of wind turbines, with large concrete bases (think parking lot and runoff). Plus you still need something to supplement for when the wind is not blowing.

I just finished some research on a small nuclear "battery". It cost \$25 million and supplies power to a town of 100,000 homes. It's life span is 30 yrs, and requires no maintenance. Do the math and your electric bill is less than \$10 per month regardless of how much you use. I like the sound of that!
