Mean,

You nailed it! For every tower over an acre or more of clearing is needed for a 2MW or larger tower, about 150 to 200'+ clearing radius. Then add in the miles of access roads that need certain turning radius and widths for the trailers. And then there is the incentives. We are led to believe that these projects are for the environment . . . renewable energy! Well the real incentives are loan subsidies, tax incentives and well truth be told credits for effluent violations, what the energy companies are producing at the plants and expelling into the air is made up by litigation towards "the advancement of renewable energy".
