There is no "ideal" dry fly weather. As long as the water temperature is in the low 50s or higher and fish are rising, it doesn't matter. But my guess is that your problem had nothing to do with the weather. You might have been able to see the leader, but there is no way trout rising to a fly would be spooked by 7x -- 4x maybe -- but definitely not 7x. My guess would be your presentation was doing the harm. Could have been micro-drag, wrong fly, color, pattern... could've even been you. Were you out of sight? Were you wearing bright colored clothing?
