FWIW, the third one in that photo group is exceptionally dangerous, and its pretty obvious to anyone who knows what to look for..

Notice how his eyes are milky? That means he's coming up on a shed, and the scales over his eyes are seperating from the new ones. WHat makes him even more dangerous than normal is because his already poor vision is compromised you're even more likely to face some aggression.

Obviously, the advise is to avoid any wild snake, but be aware that sometimes they can be even more unpredictable.
