Don't know if anyone else caught it, but yesterday on the Weather Channel they showed a problem with wind farms affecting the radar storm tracking.

Apparently wind farms show up as a severe storm.

Stephanie Abrams, one of the Weather Channel's weather forecasters (who is to team up soon with the Today's showman weatherman Al Roker for their own special forecasting in addition to the Today Show), and another weather forecaster showed a visual comparing a severe storm event and then pointed out that the identical imagery was being given off by wind farms.

I think it was an Oklahoma map.

They briefly discussed how the wind farms could easily cause an erroneous warning about severe weather.

They did mention that mapping the wind farms would probably have to be done.

Maybe we need stealth windmills.
