You can get a small unit that will mount very unobtrusive on your roof and generate enough power most of the time to be able to sell it on the grid. Combined with a few solar panels that look like roofing material, the metal stuff, and you have a house of the grid if you want.

This is something not generally in the knowledge of the public. But you could get a lot of clean energy this way. The costs have come way down.

Chaz, if you put solar panels on the roof of the average house in Pa you would only generate enough power on average to run your toaster oven for two hours a day.
