Chaz, if you put solar panels on the roof of the average house in Pa you would only generate enough power on average to run your toaster oven for two hours a day.

Not true...more lies from the naysayers...while it'll cost you some green, a reasonably sized 6.5 kw unit will reduce you consumption by 85% and you will recoup the cost in about 5 years.

You should stop reading the propoganda an try looking it up yourself. My post comes from my morning paper...the one that hates enviro-wackos but prints stories that prove its opinions to be lies.

Are you referring to solar or wind power systems?

BTW I don't have to read about it, I've done it. I designed remote communications systems which used solar backup. Come back when you can demonstrate the math to show the efficiencies and costs that give a short payback when installed in Pennsylvania. If solar power was profitable in Pennsylvania the power companies would be doing it. They have requirements to generate a percentage of their power by renewable means. They are not choosing solar.
